

Equity in the distribution of truck emissions in Toronto: Evidence from the past decade

**Jad Zalzal (Ph.D. Candidate, MSc, University of Toronto)
Department of Civil and Mineral Engineering**

May 11, 2023

Outline

1. Background on Air Pollution and Environmental Justice

2. **Study #1:** Spatial and Temporal Trends of Truck and Light-Duty Vehicle Emissions and Environmental Justice

3. **Study #2:** Traffic Emission Scenarios and Impacts on Environmental Justice

Background

Environmental Justice and Air Pollution

15,300 premature deaths per year attributed to air pollution in Canada and **6,600 in Ontario** (Health Canada, 2021)

Residents of low socioeconomic status neighborhoods are more **vulnerable** and **susceptible** to air pollution

Background

Traffic and Air Pollution

Total nitrogen oxide emissions by source, Canada, 1990 to 2019

Emissions in kilotonnes

48% of Nitrogen Oxide (NOx) transportation emissions are from diesel trucks

Emissions from trucks cause 400 yearly deaths and 8,000 YLL in the GTHA (Minet et al. 2020)

ECCC (2020)

Study #1: Spatial and Temporal Trends of Truck and Light-Duty Vehicle Emissions and Environmental Justice

POSITIVE ZERO
TRANSPORT FUTURES

Overview

Scope of Study

Estimate **light-duty vehicle (LDV) and truck volumes** on all roads in the **city of Toronto** from **2006 to 2020** through a **Machine learning approach**

Calculate **NOx and PM2.5 emissions** from trucks and LDVs for every year between 2006 and 2020

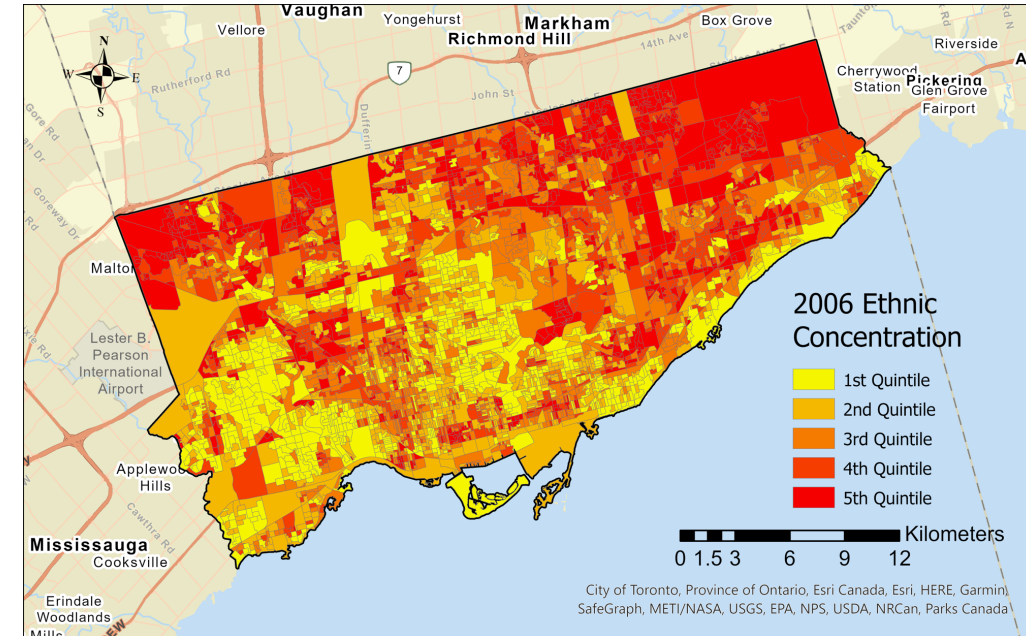

Assess **disparities in exposure** to emissions of trucks and LDVs and how they changed across the years

Methods

Environmental Justice Analysis

Marginalization Dimension	Indicators
Residential Instability	<ul style="list-style-type: none"> ➤ Population that rents their current residence ➤ Population that has moved in the past 5 years
Material Deprivation	<ul style="list-style-type: none"> ➤ Unemployed individuals ➤ Adults without a high-school diploma ➤ Low-income families ➤ Families living in poorly maintained dwellings
Ethnic Concentration	<ul style="list-style-type: none"> ➤ Population who immigrated in the past 5 years ➤ Population that identifies as a visible minority

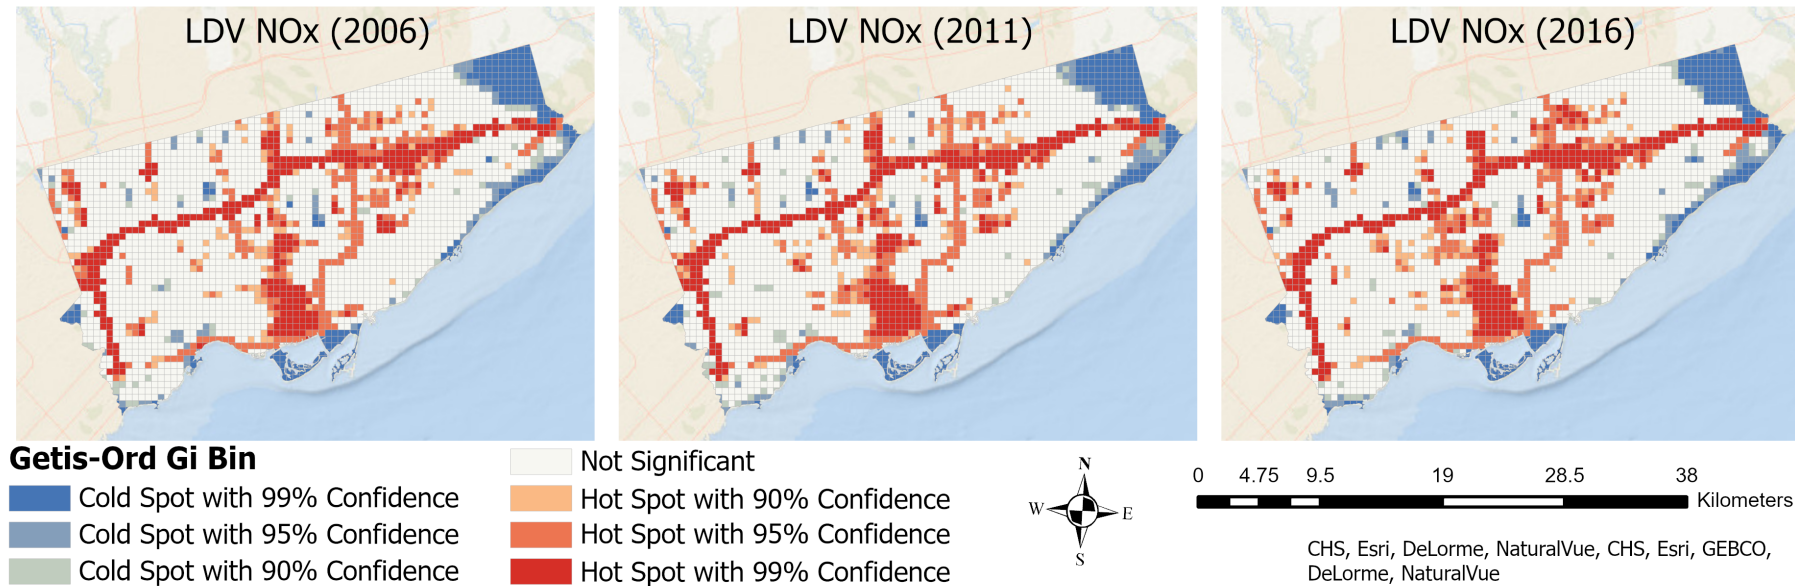

- All EJ analysis conducted at the DA level (population of 400 to 700)

Results

Traffic Hotspots

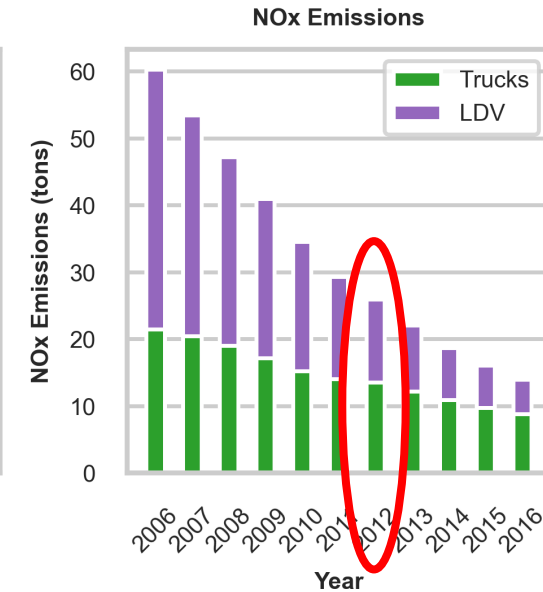

- LDV and truck spatial patterns were consistent across the years
- Different spatial patterns for trucks and LDVs

Results

Emission trends

- Overall emissions decreased by 60% and 77% for PM2.5 and NOx
- Trucks account for 5% of total VKT
- Trucks account for >60% of traffic NOx and PM2.5 emissions
- Trucks became largest source of NOx as of 2012

Results

Emission trends – Pre-vs Post COVID19

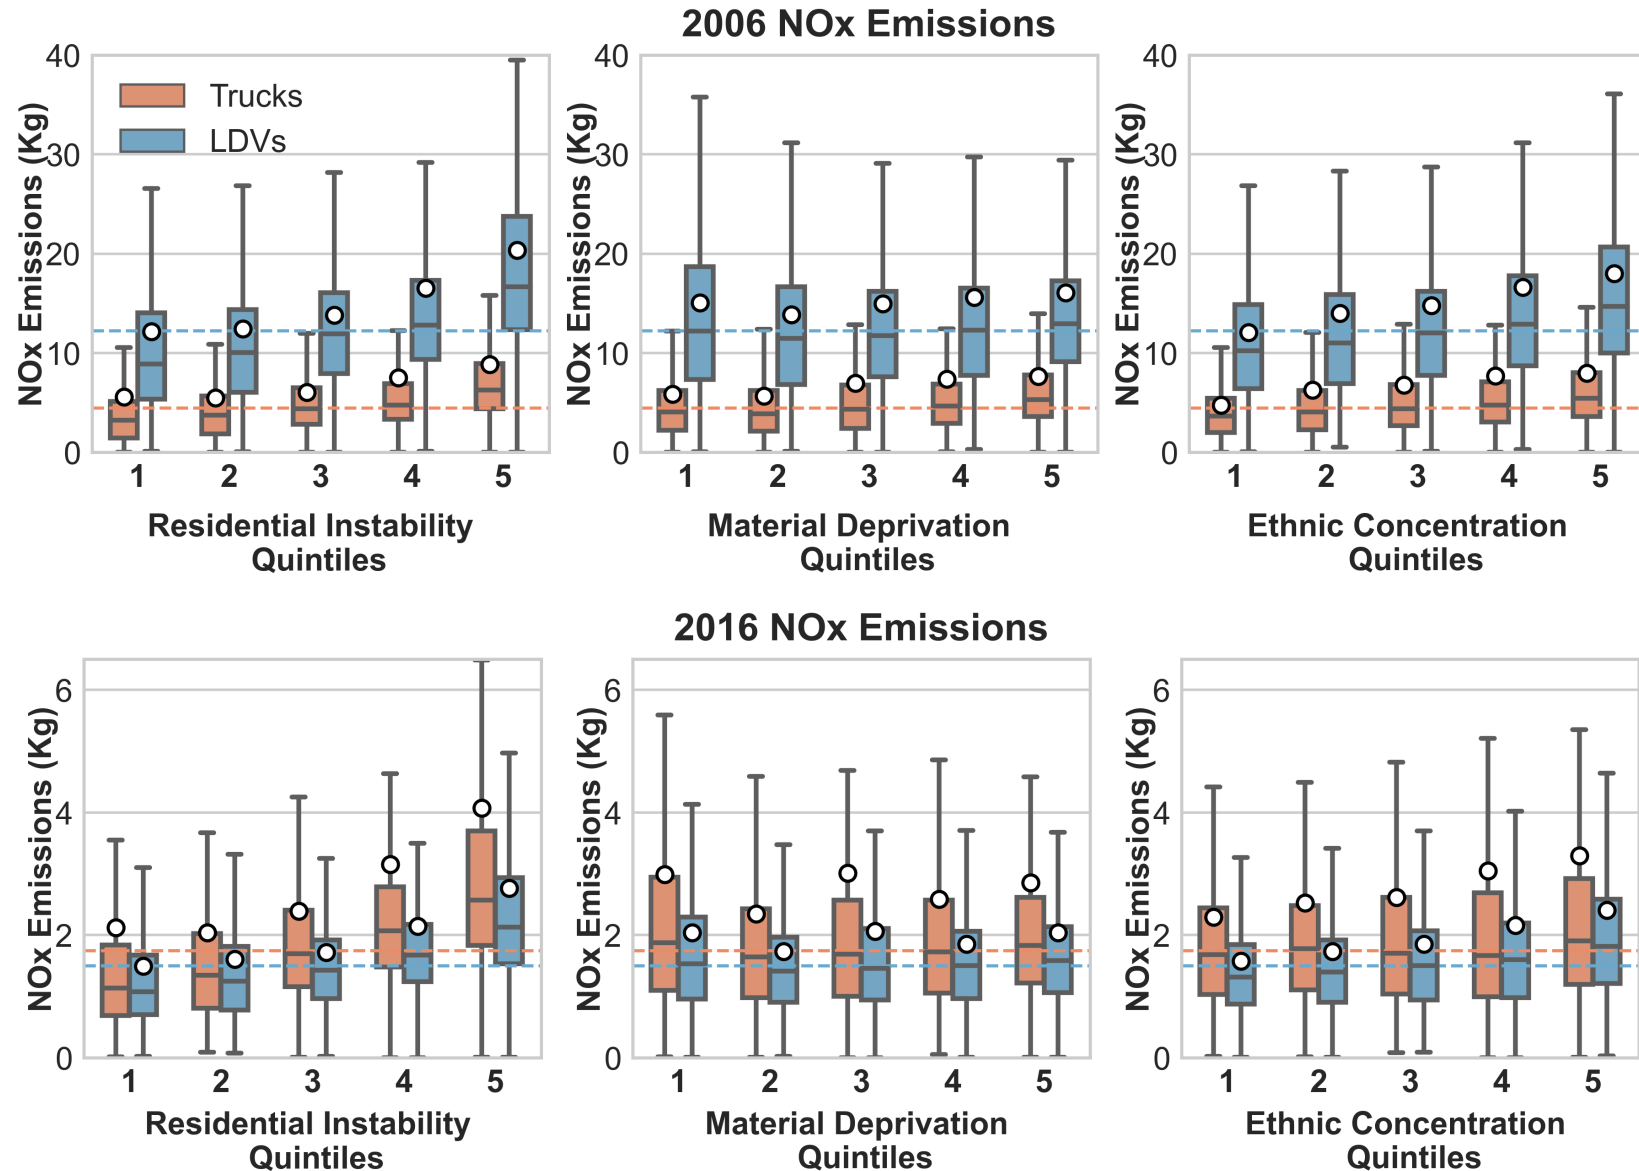

- 11% increase in truck VKT
- 28% decrease in light-duty vehicle VKT
- Emissions decreased by 12% and 16% for NOx and PM2.5

Results

EJ Analysis – Boxplots of NOx emissions

- Higher residential instability and ethnic concentration has higher NOx emissions in 2006
- Disparities only from trucks in the case of material deprivation in 2006
- Same trends for 2016 except for material deprivation
- Trucks became larger contributor to disparities compared to LDVs in 2016

Study #2: Traffic Emission Scenarios and Impact on Environmental Justice

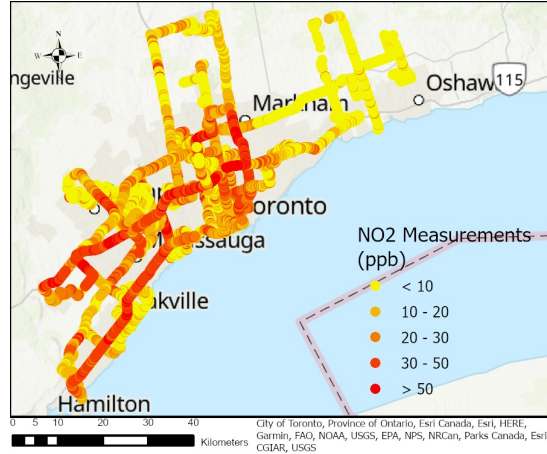

POSITIVE ZERO
TRANSPORT FUTURES

Overview

Scope of Study

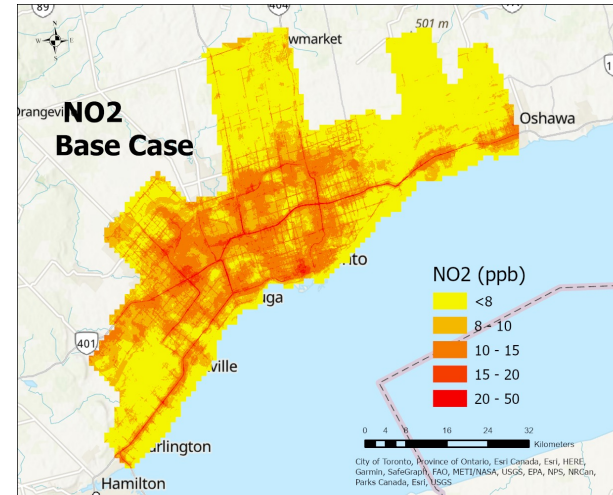

Mobile monitoring campaigns

Machine Learning Models

Concentration surfaces at 100mx100m resolution

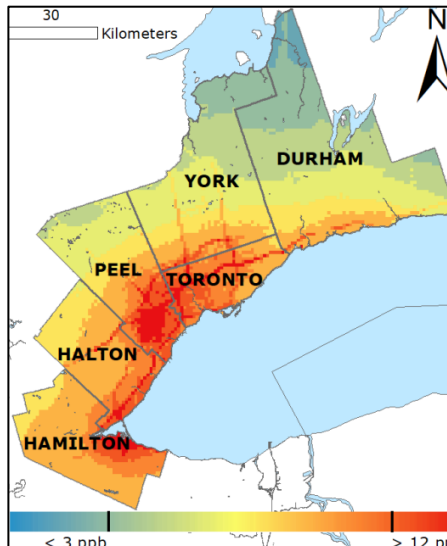

Scenarios: No Buses, No LDVs, No Trucks

Environmental Justice Analysis

CTM outputs at 1kmx1km (Minet et al. 2020)

UNIVERSITY OF TORONTO
FACULTY OF APPLIED SCIENCE & ENGINEERING

POSITIVE ZERO
TRANSPORT FUTURES

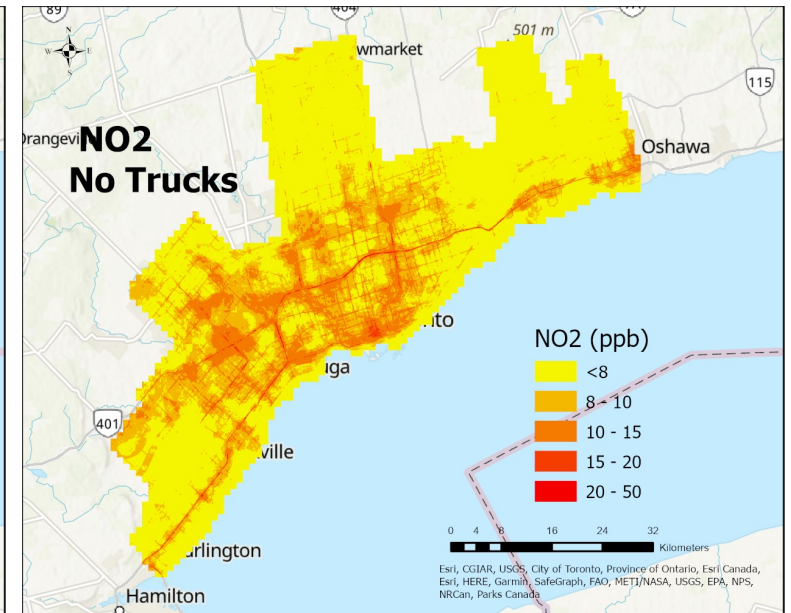

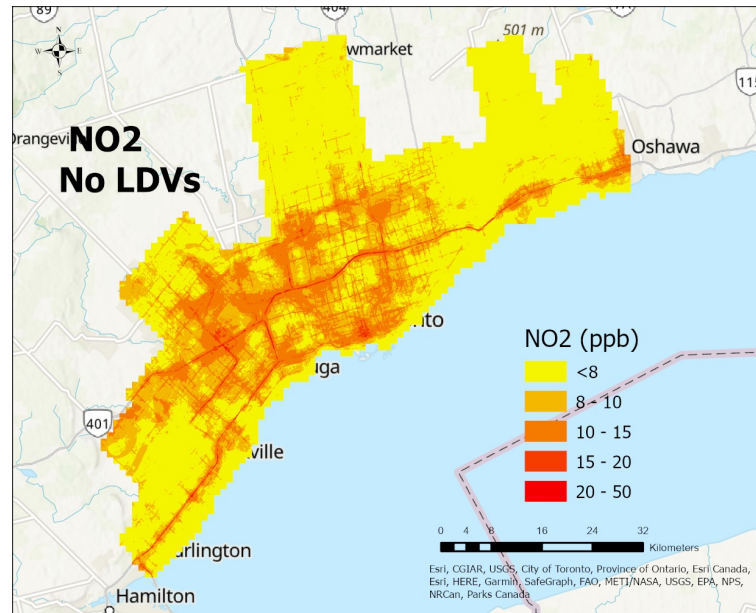

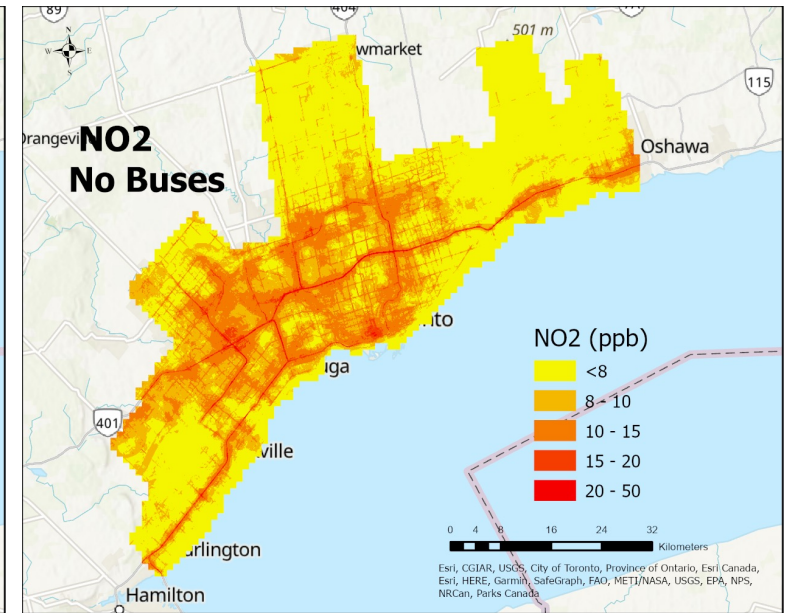

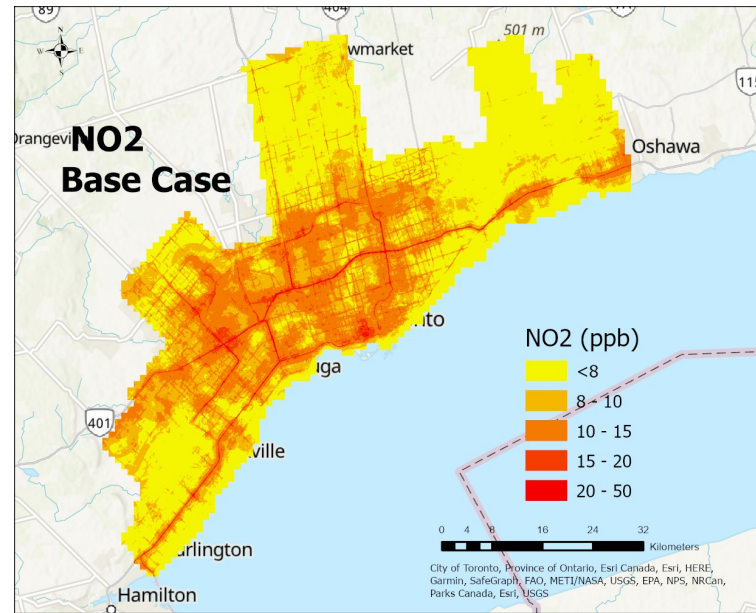

Results

Scenario Surfaces

WHO NO2 Standards:

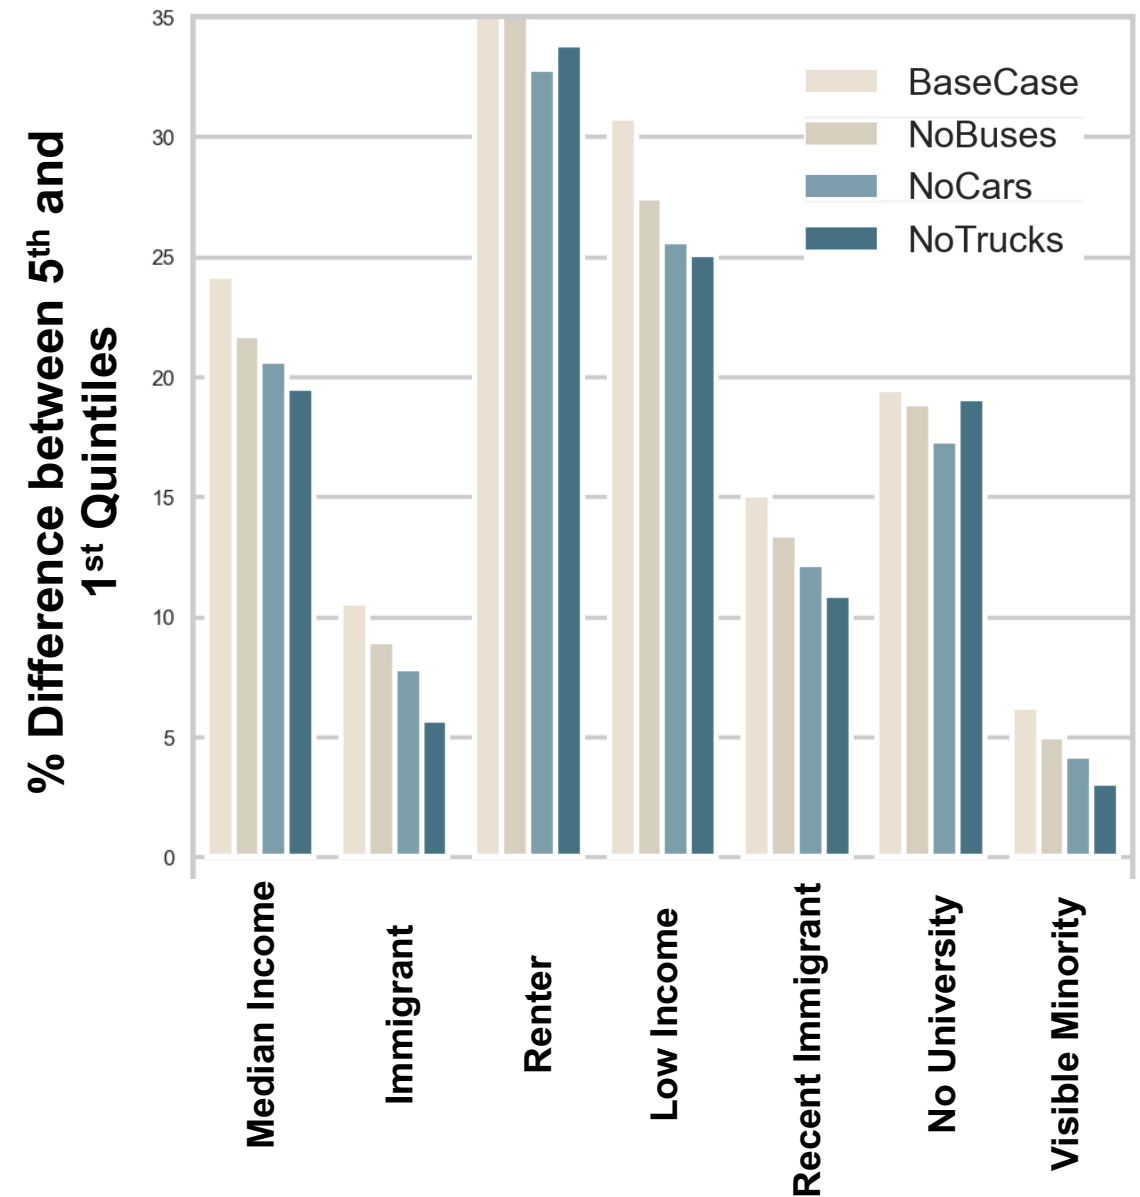

Daily = 13ppb
 Yearly = 5ppb

Results

Environmental Justice

- Large disparities were observed across all socioeconomic variables
- All scenarios resulted in a reduction in disparities
- **No Truck scenario** resulted in the largest improvements across variables
