Adonai Garcia

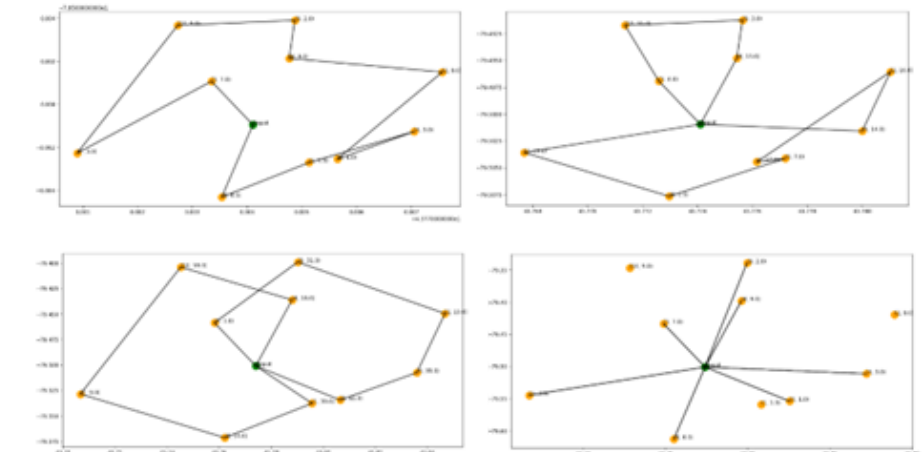

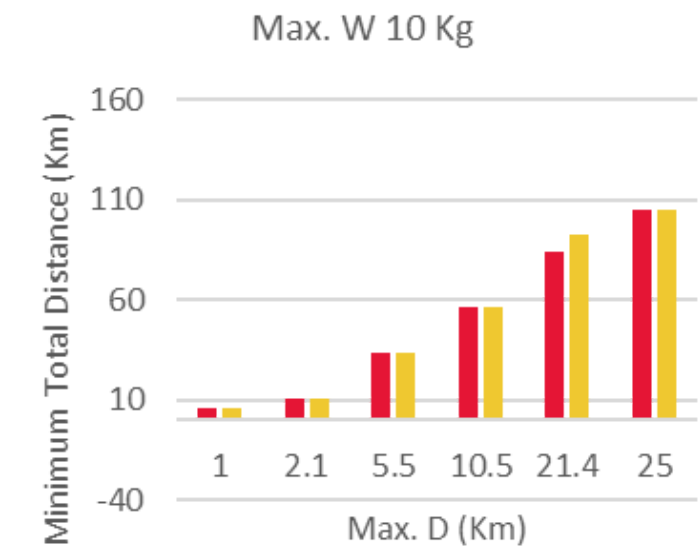

Congratulations to Adonai Garcia who was named the recipient of the 2023 Graduate Student Research Excellence Award in Civil Engineering.

The award acknowledges innovative and novel research accomplishments that have had or have the potential for significant impact in the field of [Civil Engineering](#).

The adjudication committee recognized Adonai's exceptional dedication to advancing research in transportation, sustainability and entrepreneurship, as well as his outstanding research accomplishments and leadership skills. Adonai's research focuses on route choice modelling, electric cargo bikes, GIS, urban planning and ridesharing, with the goal of shedding light on important issues related to sustainability, efficiency and safety in transportation.

Model vs. Reality

Conclusion

Literature Review

Electric Cargo Cycles (ECCs) can replace other modes

ECCs are attractive and convenient for cities and individuals

Multiple models have been developed

- Lovejoy and Handy (2012)
- Choubassi, C., Seedah, D., Jiang, N., & Walton, C. (2016)
- Niels, Holf, & Bogenberger (2018)
- Gruber and Kihm (2016)
- Koning and Conway (2016)
- Figliozzi et al. (2017, 2020)
- Sheth, M., Butrina, P., Goodchild, A., & McCormack, E. (2019)
- Dalla Chiara et al. (2020)
- ...

- MacArthur, J., Dill, J., & Person, M. (2014)
- Gruber, J., Kihm, A., & Lenz, B. (2014)
- Riggs (2016)
- Heinrich, L., Schulz, W. H., & Geis, I. (2016)
- O’Sullivan (2017)
- Anderluh, Hemmerlmayr, & Nolz (2017)
- cargobike.jetzt(2018)
- Hess, A.-K., & Schubert, I. (2019)
- Llorca, Carlos; Moeckel, Rolf (2021)
- Chiara et al. (2023)
- ...

- Tipagornwong, C., & Figliozzi, M. (2014)
- Choubassi, C., Seedah, D., Jiang, N., & Walton, C. (2016)
- Grangier et al. (2016)
- Anderluh et al. (2017)
- Wang et al. (2017)
- Naumov and Starczewski (2019)
- Shojaei, MohammadHossein (2020)
- Giglio, Carlo; Musmanno, Roberto; Palmieri, Roberto (2021)
- ...

VS

Pilot in BC

Courier and Freight company

1 Babboe Pro Trike

3 month of data

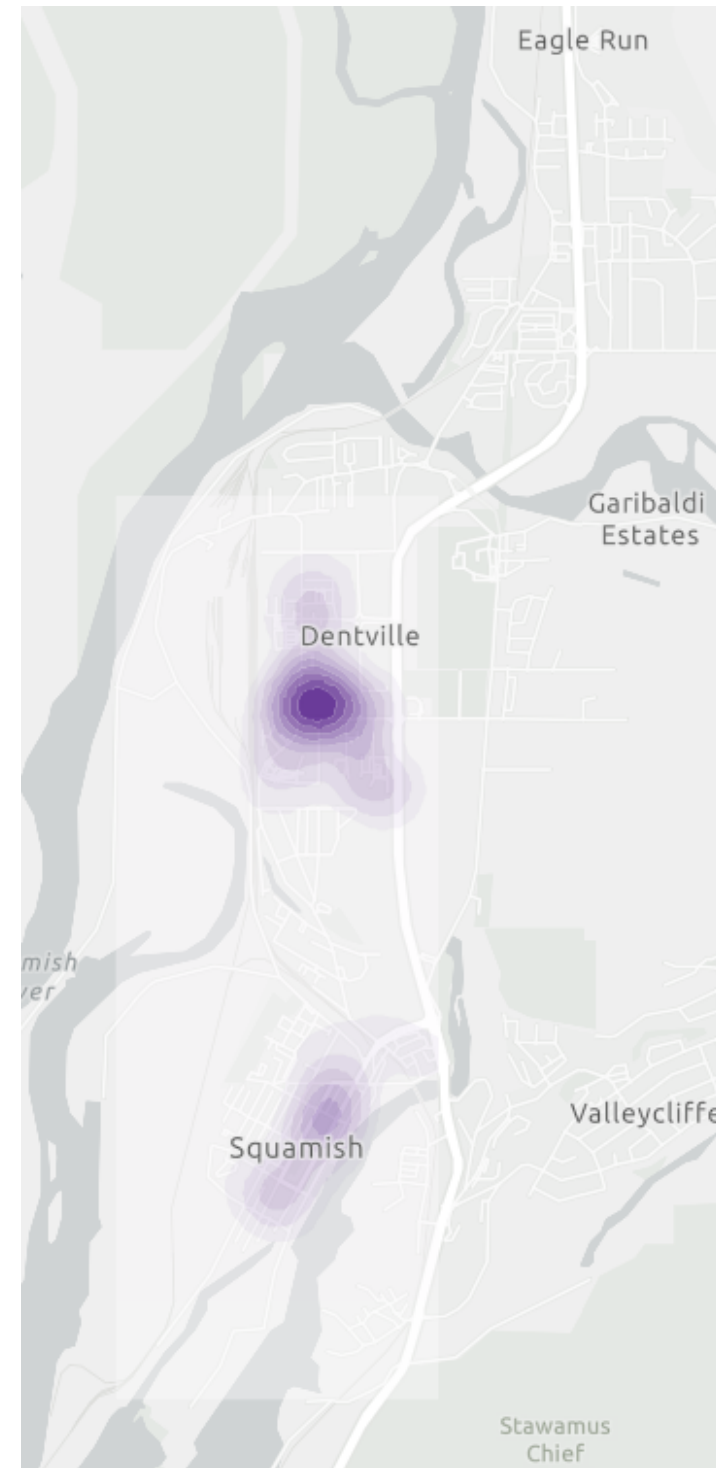

GPS points on Strava

Elevation, Weight, Speed, # Packages

55 trips, +130K points

Results

- ECC returned to the depot
- 1 trip per day
- 36 trips considered
- Customers in the same area to the depot
- No battery monitor connected
- No optimization tool used

Results

0 - 2 km/h M

Speed increases on main roads

We can identify when the user is walking or has stopped based on the speed

34.8% of the time, the speed was under 2.5 km/h

Results

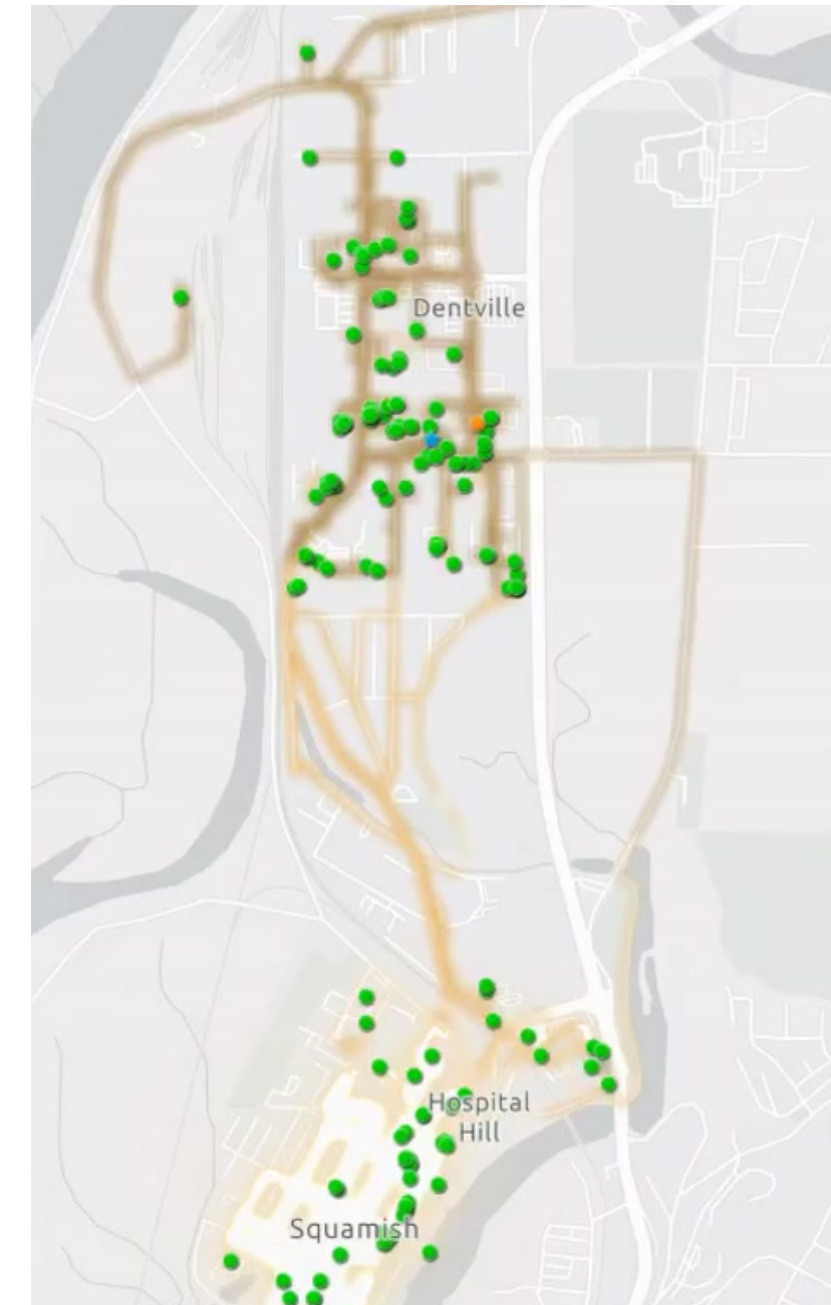

0 - 2 kg Mir

Weight is mainly concentrated around stops

The elevation changes from south to north

5 - 7 m 5.3 C

Results

Speed and Weight

Speed decreases when weight increases

Speed and Slope

Speed increases when the slope is closer to zero

Results

Speed decreases when number of packages per trip increases

$R^2 = 0.4209$

Speed and Number of Packages

Route Choice Model based on the Level of Comfort for Electric Cargo Cycles

Adonai Garcia; David Tran

Conclusion

- The model can help identify walking / stopping time.
- Speed is correlated to some of the variables considered in the model.
- ECCs need to be replaced for another three wheeler that can gather data from the battery.
- New algorithm should include other elements: type of infrastructure (road, sidewalk, etc.), mode (walking, biking), etc.
